

# Fish Protector MK01

Maintenance of waterways is crucial for the disposal of excess (rain) water. Keeping the many types of waterways free, by mowing the ditches, is vital to ensure adequate water flow.

Herder's mowing buckets are the most commonly used tools to keep the waterways free of vegetation. The Fish Protector MK01 has been developed to prevent fish mortality by mowing.

During a mowing job, the survival of our flora and fauna is taken into account as much as possible. The Code of Conduct Code of Nature for Water Boards requires, among other things, that as many nature-friendly types

of equipment are used, and protected species should be harmed as little as possible.

Herder introduces the Fish Protector MK01 for the mowing bucket to prevent fish mortality as much as possible when mowing the waterways. The Fish Protector MK01 ensures the fish-friendly mowing of the channels by using flashes of light.

Independent tests (carried out by Vis Advies) show that the flashes of light provide a short reaction to the fish, which clearly reduces the amount of fish on the shore. Besides, it does not cause long-distance expel of fish in the waterway. This means that the fish remain in their habitat.

## Fish Friendly mowing

With the Fish Protector MK01, you can mow the waterways fish-friendly by the use of four strobe lamps that give flashes. The flashes of light will alert fish and cause them to flee due to the scare reaction. This mostly prevents fish from ending up in the mowing basket and ending up on the shore.

The Fish Protector lamps are directly attached to the mowing basket. The lamps are small in size and are shock resistant and scratch-resistant. Depending on the water quality, the flashes reach up to 5 meters.

With the use of the Fish Protector, a significant contribution is made to the follow-up of the Code of Conduct Act Nature Protection for Water Boards.

With the Herder Fish protector you achieve more.
